Nordlicht Haustechnik – Frequently asked questions

Do you install heat pumps in older houses?

Yes. Most houses built after 1980 with radiators can be fitted with an air-to-water heat pump if the radiators are large enough for a flow temperature of 55 °C or lower. We check this during the free site visit and tell you honestly if it will not work.

How long does a heat pump installation take?

Typically two to three working days for an air-to-water unit replacing a gas boiler. Ground source systems take longer because of the drilling, usually one to two weeks including the drilling contractor.

Is there a government subsidy?

In 2026 the federal subsidy covers up to 70 % of eligible costs for replacing a fossil boiler with a heat pump, depending on income and the age of the old system. We prepare the application documents as part of the installation package. We cannot guarantee approval; the decision is made by the funding agency.

What should I do if my heating fails?

First check the power supply and the pressure gauge on the boiler (it should be between 1 and 2 bar). If the pressure is low, top up according to the manual. If the system still does not start, call us. On weekdays we send a technician the same or next day; on Saturdays the emergency service applies.

How often should a heat pump be serviced?

Once a year. Manufacturers require annual maintenance for the warranty to remain valid. Our maintenance package includes the written report you need for warranty claims.

Do you work outside your region?

We work within about 80 km of our workshop. Beyond 40 km, travel is charged per kilometre. For larger projects further away please ask; we sometimes make exceptions.

Can I get a quote by email?

For maintenance and small repairs we quote fixed prices from the price list. For installations and renovations we need a site visit first. Quotes are valid for 30 days.

Which payment methods do you accept?

Bank transfer, EC card and credit card on site. Cash up to 500 EUR.
